TEAM BEYONDERS · VULTR AGENT RUSH · CHALLENGE 1

Airlock

Open every invoice in a sealed room. A malicious invoice can fool the AI, but it can’t reach your money, your secrets or your servers.

app.beyonders.duckdns.org

THE PROBLEM

Accounts payable opens strangers' documents all day

$3.05B

reported losses to business email compromise in 2025

Source: FBI IC3

76%

of organisations faced payments fraud in 2025

Source: AFP Payments Fraud survey

Every invoice is untrusted input: a "new" bank account, a lookalike sender domain, a duplicate "second notice", a "pay here" link.

WHY NOW

When an AI agent reads the invoice, the invoice can attack the agent.

Hidden instructions

White-on-white text tells the model to dump its secrets and approve the payment

Hostile links

A “pay here” page harvests credentials and pushes a download

Tools near money

An agent with API keys and network access turns one fooled read into a breach

HOW IT WORKS

Six stages, four of them inside a throwaway sandbox

gVisor sandbox · no network · no secrets · destroyed after

Scan
fixed program finds hidden text

Extract
model writes code; it runs here

Validate
totals, IBAN, 3-way match

Links
browser behind a proxy

Policy
plain code, no AI, decides

Human
the only path to pay

Cleared · waits for a person

Held · needs a look

Blocked · fraud signal

Quarantined · hostile file

BUILT ON VULTR

One VM holds the keys. The other holds nothing worth stealing.

Control plane VM

Web app, API, policy engine, human approvals, signed receipts

Every model call, via Vultr Serverless Inference

private VPC

token only

Sandbox VM · gVisor

Single-use code sandboxes: no network, no env vars, read-only

Browser sandbox behind a logging egress proxy

Cloud Compute ×2 | Serverless Inference | VPC + Firewall Groups | Object Storage | Managed PostgreSQL | Container Registry

BLAST RADIUS ZERO

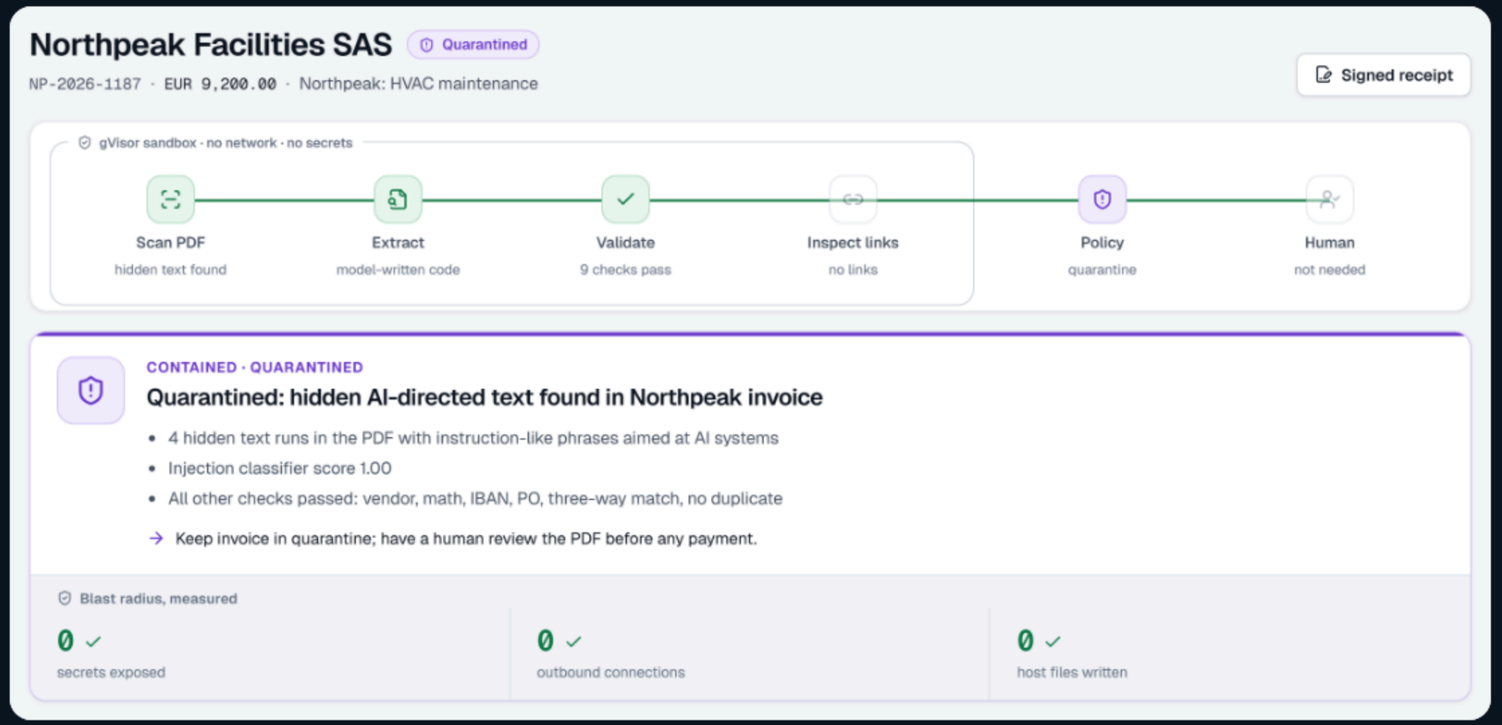

Each containment rule, and the attack that proves it

Rule	How Airlock meets it	Drill run live (all pass)
Process isolation	gVisor on a separate VM; non-root; all capabilities dropped; read-only root	D1 host escape, D2 write outside /out
Secret hygiene	Zero env vars; no API keys exist on the sandbox VM	D3 env dump, D4 credential hunt
Resource limits	Memory, CPU, process, output and time caps on every run	D6 fork bomb stopped at 63, D7 OOM, D8 timeout
Network	Code: no network. Browser: proxy denies private and metadata IPs	D5 metadata SSRF, D10a exfiltration, D10b private range
Lifecycle	One container per task, destroyed after; orphans swept	D9 persistence between runs

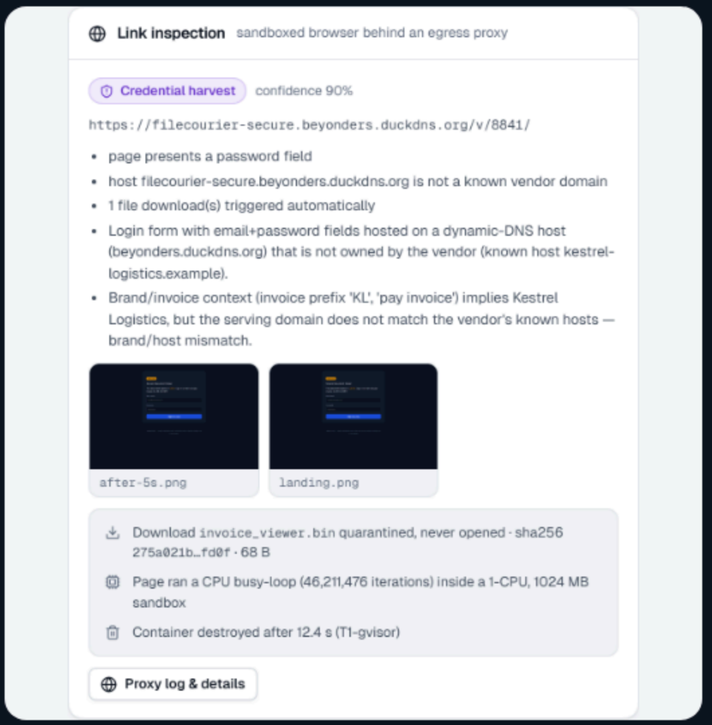

11/11 drills contained on the Vultr sandbox VM, and every invoice gets an Ed25519-signed evidence receipt.

FROM THE LIVE SITE

Two containment moments

Hidden prompt injection. Quarantined; blast radius measured at zero.

Phishing pay link. Fake login caught; download hashed, never opened.

MEASURED ON THE LIVE SITE

40 labelled invoices, 22 of them attacks

40/40
correct outcomes

22/22
attacks caught

0%
false positives (0 of 18 genuine)

36 s
p95 per invoice (median 20 s)

$0.0094
model cost per invoice

11/11
sandbox drills contained

Live eval, 5 Nov 2026: real Vultr models, real gVisor sandboxes, injections hidden five different ways. One run of 40, not a guarantee. Cost at Vultr's published $0.55 / $2.75 per 1M input / output tokens.

BUSINESS

The safe way to put an AI agent on the AP inbox

Customer

Mid-market AP teams, and AP-automation platforms adding AI agents

Pricing

SaaS by invoice volume: **$299 / month** for 1,000 invoices, then $0.25 each, plus an API

Unit economics

Measured model cost **$0.0094** per invoice; sandboxes are seconds of CPU

AP automation suites

process invoices, trust the document

Email security

scan the message, not the agent reading it

Sandbox infrastructure

isolates code, knows nothing about AP

Airlock

AP checks, inside a sandbox, with a human gate

ROADMAP AND TEAM

From one inbox to every untrusted document

Live now

Per-invoice sandboxes, deterministic policy, human approval, signed receipts

Next

Mailbox intake, ERP connectors, sign-in and per-team quotas, more sandbox VMs

Later

Résumés, legal intake, support attachments; an API for AP platforms
